                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Strategene's first-strand synthesis primer was used Strategene's first-strand synthesis, the CDNA ends were 'polished' with clone Fitu DNA polymerase, ligated to EcoRI adapters, and phosphorylated. The XhoI site within the first-strand synthesis primer was restricted by digestion with XhoI; all XhoI sites in the CDNA would be protected by their hemimethylated status. The CDNA constructs were size-fractionated with a Soubp cutoff, using GibcoBRI Life Fechnologies' CDNA Size Fractionation column. The column eluent was then ligated into Stratagene's pBluescript II XR Predigested vector (pBluescript II SK(+) that had been digested with EcoRI and XhoI, and phosphorylated). Both the white and blue colonies appear to contain recombinant plasmids with CDNA inserts. Blue colonies 9n=15) have been sequenced, and possess putative CDNA inserts. This library was constructed by Doy. Paul Keim & Virginia H. Coryell, Department of Biology, BoxS640, Northern Arizona University, Flagstaff, AZ 86011, Phone: 520-523-1078 (Dr. Pull, Reim, Coryell), email: paul Keim, coryell@nau.edu, virginia.coryell@nau.edu.

/clone_lib="Gam-clood"
/note="Vector: pBluescript II XR; Site_1: EcoRI; Site_2:
XhoI; Root cDNA. The mRNA was isolated from entire roots
of 8 day old 'Williams' seedlings which were propagated on
paper towels with distilled water. Stratagene's CDNA
Synthesis Kit (catalog #200401) was used to synthesis the
CDNA. First- strand synthesis was performed with 5-methyl
dCTP, hence the ligated CDNA is hemimethylated.

XhoI; At the trifoliate stage, M. truncatula plants were transplanted to phosphate-free sand and grown for a further 30 days. During this period, they were fertilized twice weekly with 1/2 Hoaglands solutions containing 20um potassium phosphate. cDNA was prepared from polyA+ enriched RNA. The CDNA was directionally ligated into the Unizap XR vector from Strateagene and packaged using Gigapack III Gold packaging extracts. Plasmids containing phase using Ex-assist helper phage and propagated in

consisting of a poly(dT) sequence with an XhoI restriction site. EcoRI adaptors were ligated to the blunt-ended cDNA fragments followed by XhoI digestion. The CDNA insert is protected from KhoI digestion via methylation during first strand synthesis. The CDNA fragments were directionally closed into the EcoRT-XhoI restriction site of the PBJURESCRIPT restriction site of the transformed into E.coli ElectroMax DHIOB host cells. Plant care, inoculations, and library construction were performed by Steve Clough (Lila Vodkin lab, University of Illinois).

/note="Wector: pBluescript II SK+; Site 1: EcoRI; Site 2:
XhO1; The CDNA library was constructed from mRNA isolated
from 9-11 day old seedlings that were induced for HR
(hypersensitive response) by vacuum infiltrating plant
tissue with Pseudomonas syringae pv. glycinea carrying the
avrB gene (Genetics 141:1597-1604). Plant tissue (expanded
unifoliate leaves) was collected at 2, 4, 8, 12, 24, 36,
and 53 hrs after inoculation and their mRNA pooled equally
for cDNA construction. The library was prepared using the
Stratagene pBluescript II SK(+) library construction kit.
Complementary DNA was synthesized from mRNA using a primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    4444 Forest Park Parkway, Box 8501, St. Louis, MO 63108, USA Tel: 314 286 1800

/note="Vector: pBluescript SK-; Site_1: EcoRI; Site_2:
Xhoi; cDNA was prepared from polyA+ enriched RNA. The cDNA
was directionally ligated into the Unizap XR vector from
Stratagene and packaged using Gigapack III Gold packaging
extracts. Plasmids containing cDNA inserts were excised
from the recombinant lambda-Zap phage using Ex-assist
helper phage and propagated in XLOLR cells."

//note=Tubscalon library was constructed from mRNA isolated from xhoi; The CDNA library was constructed from mRNA isolated from 2-3 week old seedlings that were induced for symptoms of SDS (Sudden Death Syndrome) disease by the translocation of culture filtrate of Fusarium solani f. Sp. glycines (Plant Cell Report 18:375-380). Cultivar PI 567374 is partially resistant to the disease SDS. Plant tissue (expanded leaves, folded leaves, and new shoots) were collected at 1, 6, 24, and 48 hrs. after inculation and their mRNA pooled equally for CDNA construction. The library was prepared using the Stratagene pBluescript II SK(+) library was prepared using the Stratagene pBluescript II SK(+) library was prepared using the Stratagene pBluescript II sapports were ligated to the blunt-ended CDNA fragments apply(dT) sequence with an XhoI restriction site. BcoRI adaptors were ligated to the blunt-ended CDNA fragments followed by XhoI digestion. The CDNA inscribed conditionally cloned into the EcoRI-XhoI restriction site of the pBluescript vector. The ligated cDNA fragments were transformed into B.coll ElectroMax DHIOB host cells. Plants were inoculated by Shuxian Li (Glen Hartman lab, University of Illinois). Library was constructed by Steve Clough (Lila Vodkin lab, University of Illinois).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This clone is available through: ResGen, Invitrogen Corp. 2130

/note="Vector: pBluescript SK-; Site_l: EcoRI; Site_2:
Xhol; cDNA was prepared from polyA+ enriched RNA. The cDNA was directionally ligated into the Unizap XR vector from Stratagene and packaged using Gigapack III Gold packaging extracts. Plasmids containing cDNA inserts were excised from the recombinant lambda-Zap phage using Ex-assist helper phage and propagated in XLOLR cells."

The cDNA library was prepared using the Stratagene pBluescript II XR library construction kit. Complementary DNA was synthesized from mRNA using a primer consisting of a poly (dT) sequence with a XhoI restriction site. EcoRI adapters were ligated to the blunt-ended cDNA fragments followed by XhoI digestion. The cDNA fragments were directionally cloned into the EcoRI-XhoI restriction site of the pBluescript vector. The ligated cDNA fragments were transformed into XLIO-Gold host cells. This library was constructed by Dr. Randy Shoemaker and Dr. John

/note="Vector: pBluescript SK-; Site_1: EcoRI; Site_2:
XhoI; cDNA was prepared from polyA+ enriched RNA. The cDNA was directionally ligated into the Unizap XR vector from Stratagene and packaged using cigapack III Gold packaging extracts. Plasmids containing cDNA inserts were excised from the recombinant lambda-Zap phage using Ex-assist helper phage and propagated in XLOLR cells."
